

MOOG

D680 Series
Proportional Control Valves
with Integrated Electronics
ISO 4401 Size 05 to 10

SECTION	PAGE	MOOG SERVO- AND PROPORTIONAL CONTROL VALVES
General	2	For over 50 years Moog has manufactured proportional control valves with integrated electronics. During this time, more than 200,000 valves have been delivered.
Benefits and Functionality	3	These servo- and proportional control valves have been proven to provide reliable control for injection and blow molding equipment, die casting machines, presses, heavy industry equipment, paper, lumber processing, and other applications.
General Technical Data and Symbols	4	
Function, Electronic	5	
Technical Data	8	PROPORTIONAL CONTROL VALVES, D681 TO D685 SERIES
Valve Electronics	28	The D680 Series Proportional Flow Control Valves are throttle valves for 2-, 3-, 4- and 5-way applications.
Failsafe Version	32	These valves are suitable for electrohydraulic position, velocity, pressure or force control systems, including those with high dynamic response requirements.
Input Command Wiring Schematic	40	
Ordering Information	41	With the new D633 Series directly driven pilot valve (DDV), a further important step has been made in the direction of robustness and energy saving. This linear force motor driven pilot valve is developed as a variant of the proven Moog DDV Series.
		The integrated electronics of the D680 series is also a new development featuring SMD technology, and requires 24 V DC power supply.

The valve series described in this catalog have successfully passed EMC tests required by EC Directive. Please refer to the respective references in the Electronics Section.

NOTICE

- Before installation of the valve into the system, the complete hydraulic system must be flushed (according to ISO 6072).
- Please read the notes in section entitled "Electronics", page 6.

Our Quality Management System conforms to DIN EN ISO 9001.

This catalog is for users with technical knowledge. To ensure that all necessary characteristics for function and safety are given, the user has to check the suitability of the products described herein. The products described herein are subject to change without notice. In case of doubt, please contact Moog Inc.

Moog is registered trademark of Moog Inc. and its subsidiaries. All trademarks as indicated herein are the property of Moog Inc. and its subsidiaries. Moog Inc. 2003. All rights reserved. OPERATIONAL FEATURES OF THE DIRECT DRIVE PILOT VALVE

- A direct drive pilot valve requires no pilot leakage flow. This results in considerable energy savings, especially for systems with multiple valves.
- The dynamics of the direct drive valve is nearly independent of the operating pressure.
- Reliable operation. The excellent pressure gain of the pilot valve with spool / bushing, provides high spool driving forces to the long stroke main spool. This ensures enhanced main spool position control even with high flow forces and contaminated fluids.
- Excellent dynamics based on a high natural frequency allows high main spool position loop gain, resulting in extremely good static and dynamic response of the main valve.

OPERATIONAL FEATURES OF THE COMPLETE VALVE

- Valve body for high rated flow, optional with external pilot supply using X and Y ports.
- Reduced spool drive area with D683 and D684 Series results in the following advantages:
 - improved dynamic response
 - reduction in pilot fluid flow for fast movements of the main spool.
- Failsafe versions available with defined safe spool position using a spring and a 4/2-way solenoid valve for control flow short circuit.
- The D680 series proportional control valves are of two-stage design. By combining a fast first stage, suitable main spool drive area and integrated electronics, an optimum proportional valve can be offered.

DESCRIPTION OF THE DIRECT DRIVE PILOT VALVE

The D633 Series pilot valve consists of a permanent magnet linear force motor, a drive rod connecting motor armature and the spool guided in a bushing. The linear force motor contains a coil, permanent magnets, pole pieces, an armature and a centering spring arrangement.

The 4-way spool controls fluid flow from the pressure port to one of the load ports, and also from the other load port to return. Deflection of the centering spring due to spool displacement, provides a return force for the armature.

An electric current applied to the coil of the linear force motor produces an electromagnetic flux depending on the current polarity. This electromagnetic flux is superimposed on the permanent magnetic flux in the airgaps between armature and pole pieces. This results in a polarity dependent displacement of the armature against the centering spring force.

The spool being connected to the armature by a rod shares the armature motion. Flow forces acting on the spool due to the fluid flow through the valve, and friction forces between spool and bushing due to contaminated fluid, are overcome by the force motor. The position of the spool is approximately proportional to the coil current.

OPERATING PRINCIPLE OF THE COMPLETE VALVE

The position control loop for the main stage spool, position transducer and pilot valve is closed by the integrated electronics.

An electric command signal (flow rate set point) is applied to the integrated position controller which drives the current in the pilot valve coil.

The position transducer (LVDT) which is excited via an oscillator, measures the position of the main spool (actual value, position voltage). This signal is then demodulated and fed back to

the controller where it is compared with the command signal. The controller drives the pilot valve until the error between command signal and feedback signal is zero.

Thus, the position of the main spool is proportional to the electric command signal.

PERFORMANCE SPECIFICATIONS FOR D681 TO D685

Operating pressure range	
Ports P, A and B	up to 350 bar (5000 psi)
Port T	see data of individual series
Pilot pressure	min. 10 bar (150 psi) over T or Y max. 350 bar (5000 psi)
Temperature range	
Ambient	-20 °C to +60 °C (-4°F to +140°F)
Fluid	-20 °C to +80 °C (-4°F to +170°F)
Seal material	NBR, FPM, and others on request
Operating fluid	mineral oil based hydraulic fluid (DIN 51524 part 1 to 3) and ISO 11158, other fluids on request
Viscosity	
recommended	15 to 45 mm ² /s
allowed	5 to 400 mm ² /s
System filtration	
Pilot valve:	high pressure filter (without bypass, but with dirt alarm) mounted in the main flow and if possible, directly upstream of the valve.
Main stage:	high pressure filter as for the pilot stage. In combination with a fast regulating variable displacement pump, an off-line filter is recommended.
Class of cleanliness	
The cleanliness of the hydraulic fluid particularly effects the performance (spool positioning, high resolution) and wear (metering edges, pressure gain, leakage) of the valve.	
Recommended cleanliness class	
For normal operation	ISO 4406 < 18 / 15 / 12
For longer life	ISO 4406 < 17 / 14 / 11
Recommended filter rating	
For normal operation	$\beta_{10} \geq 75$ (10 μm absolute)
For longer life	$\beta_6 \geq 75$ (6 μm absolute)
Installation options	any position, fixed or movable
Vibration	30 g, 3 axes
Degree of protection	EN60529: IP 65, with mating connector mounted
Shipping plate	Delivered with an oil sealed shipping plate

VALVE FLOW CALCULATIONS

The actual valve flow is dependent on the spool position and the pressure drop across the spool lands.

At 100% command signal (i.e. +10 VDC = 100% valve opening), the valve flow at rated pressure drop $\Delta p_N = 5$ bar (75 psi) per metering land is the rated flow Q_N . For other than rated pressure drop, the valve flow changes at constant command signal according to the square root function for sharp edged orifices.

$$Q = Q_N \cdot \sqrt{\frac{\Delta p}{\Delta p_N}}$$

Q / l / min = calculated flow
 Q_N / l / min = rated flow
 Δp / bar = actual valve pressure drop
 Δp_N / bar = rated valve pressure drop

The actual valve flow Q calculated in this way, should result in an average flow velocity in ports P, A, B or T of less than 30 m/s.

Valve flow diagram

Valve flow for maximum valve opening (100% command signal) as a function of the valve pressure drop.

FUNCTION

D681-D685

D681 Series 2-stage Proportional Control Valve with D633-7... Series Pilot Valve

Hydraulic symbol:
Symbol shown with pilot pressure, without electric supply on enable signal off. Failsafe spool position A → T.

GENERAL REQUIREMENTS FOR VALVE ELECTRONICS

- Supply 24 V DC, min. 18 V DC, max. 32 V DC
Current consumption I_{max} at D68X 200 mA static
800 mA dynamic
External fuse per valve at D68X 1.0 A (slow)
- All signal lines, also those of external transducers, shielded.
- Shielding connected radially to \perp (0 V), power supply side, and connected to the mating connector housing (EMV).
- EMV: Meets the requirements of emission:
EN55011:1998+A1:1999 (limit class: B)
and immunity: EN61000-6-2:1999
- Minimum cross-section of all leads $\geq 0.75 \text{ mm}^2$ (AWG 18). Consider voltage losses between cabinet and valve.
- Note: When making electric connections to the valve (shield, \oplus), appropriate measures must be taken to ensure that locally different earth potentials do not result in excessive ground currents. Also see Moog Technical Note TN 353.

VALVE ELECTRONICS WITH SUPPLY VOLTAGE 24 VOLT AND 6+PE POLE CONNECTOR

Command signal 0 to ±10 mA floating,
 Valves with current command input
 The spool stroke of the valve is proportional to $I_D = -I_E$.
 100% valve opening P → A and B → T is achieved at $I_D = +10$ mA. At 0 mA command, the spool is in centered position. The input pins D and E are inverting. Either pin D or E is used according to the required operating direction. The other pin is connected to signal ground at cabinet side.

Command signal 0 to ±10 V,
 Valves with voltage command input
 The spool stroke of the valve is proportional to $(U_D - U_E)$.
 100% valve opening P → A and B → T is achieved at $(U_D - U_E) = +10$ V. At 0 V command, the spool is in centered position. The input stage is a differential amplifier. If only one command signal is available, pin D or E is connected to signal ground at cabinet side according to the required operating direction.

Actual value 4 to 20 mA
 The actual spool position value can be measured at pin F (see diagram on the top). This signal can be used for monitoring and fault detection purposes. The spool stroke range corresponds to 4 to 20 mA.
 The centered position is at 12 mA. 20 mA corresponds to 100% valve opening P → A and B → T.

Circuit diagram for measurement of actual value I_F (position of main spool) for valves with 6 + PE pole connector (signal "M and X")

(Signal type "D" R_L integrated on electronics)

The position signal output 4 to 20 mA allows to detect a cable break when $I_F = 0$ mA. For failure detection purposes, it is advised to connect pin F of the mating connector and route this signal to the control cabinet.

Note: Enable input

With enable signal off, the main spool will move to a safe position. Spool position ± 3%.

- a) Defined centered position (Unbiased pilot valve). Function code A¹⁾
- b) End position (Biased pilot valve). Function code B¹⁾

¹⁾ see type designation

WIRING FOR VALVES WITH 6+PE POLE CONNECTOR

To EN 175201 Part 804, and mating connector (metal shell) with leading protective earth connection ($\frac{1}{3}$). Also see input command wiring schematic, Page 40 (see additional information in AM 426 E spec.).

- 1 Valve
- 2 Connector
- 3 Mating connector

Function	Voltage command	Current command
A Supply	24 V DC (min. 18 V DC, max. 32 V DC)	Static: $I_{max}: 200$ mA Dynamic: $I_{max}: 800$ mA
B Supply / Signal ground	± (0 V)	
C Enabled Not enabled	$U_{C-B} > +8.5$ V DC $U_{C-B} < +6.5$ V DC	$I_e = 2,0$ mA at 24 V DC, max. 32 V DC (see note above)
D Input rated command E (differential)	$U_{D-E} = 0$ to ± 10 V $R_e = 10$ kΩ	Input command $I_D = -I_E: 0$ to ± 10 mA ($R_e = 200$ Ω)
F Output actual valve Spool position	Inputs for U_{D-B} and U_{E-B} for both signal types limited to min. -15 V and max. +32 V $I_{F-B} = 4$ to 20 mA. At 12 mA spool is in centred position. $R_L = 100$ bis 500 Ω Signal code D: $U_{F-B} = 2$ to 10 V. At 6 V spool is in centred position. $R_L = 500$ Ω	
⊕ Protective earth		

Additional information on command signal on page 40.

VALVE ELECTRONICS WITH SUPPLY VOLTAGE 24 VOLT AND 11+PE POLE CONNECTOR

Command signal 0 to ±10 mA floating,
 Valves with current command input
 The spool stroke of the valve is proportional to $I_4 = -I_5$.
 100% valve opening P → A and B → T is achieved at $I_4 = +10$ mA. At 0 mA command, the spool is in centered position. The input pins D and E are inverting. Either pin 4 or 5 is used according to the required operating direction. The other pin is connected to signal ground at cabinet side.

Command signal 0 to ±10 V,
 Valves with voltage command input
 The spool stroke of the valve is proportional to $(U_4 - U_5)$.
 100% valve opening P → A and B → T is achieved at $(U_4 - U_5) = +10$ V. At 0 V command the spool is in centered position. The input stage is a differential amplifier. If only one command signal is available, pin 4 or 5 is connected to signal ground at cabinet side according to the required operating direction.

Actual value 4 to 20 mA
 The actual spool position value can be measured at pin 6 (see diagram on the top). This signal can be used for monitoring and fault detection purposes. The spool stroke range corresponds to 4 to 20 mA.
 The centered position is at 12 mA. 20 mA corresponds to 100% valve opening P → A and B → T.

Circuit diagram for measurement of actual value I_6 (position of main spool) for valves with 11 + PE pole connector (signal "M and X")

(Signal type "D" R_L integrated on electronics)
 The position signal output 4 to 20 mA allows to detect a cable break when $I_6 = 0$ mA. For failure detection purposes, it is advised to connect pin 6 of the mating connector and route this signal to the control cabinet.

Note: Enable input
 With enable signal off, the main spool will move to a safe position. Spool position ± 3%.

- a) Defined centered position (Unbiased pilot valve). Function code J or G
- b) End position (Biased pilot valve). Function code H¹⁾

INSTALLATION DRAWING (mm)

The mounting manifold must conform to ISO 4401-05-05-0-94. Attention: Notice O-ring recess dia of X and Y ports. For valves in 4-way version with $Q_N > 60$ l/min and in 2x2-way version, the non standard 2nd return port T_2 must be used. With 5-way version type B80..., replace T_2 to P_2 . For maximum flow, the manifold ports P, T, A and B are required to have 11.5 mm dia (deviation from standard). Mounting surface needs to be flat within 0.01 mm over a distance of 100 mm. Average surface finish value, R_a , better than 0.8 μ m.

INSTALLATION DRAWING (mm)

The mounting manifold must conform to ISO 4401-07-06-0-94. For maximum flow, the manifold ports P, T, A and B are required to have 20 mm dia (deviation from standard). Mounting surface needs to be flat within 0.01 mm over a distance of 100 mm. Average surface finish value, Ra, better than 0.8 µm.

INSTALLATION DRAWING (mm)

The mounting manifold must conform to ISO 4401-10-08-0-94
 For maximum flow, the manifold ports P, T, A and B are required to have 50 mm dia (deviation from standard).
 Mounting surface needs to be flat within 0.02 mm over a distance of 100 mm. Average surface finish value, Ra, better than 0.8 µm.

VALVES FOR APPLICATIONS WITH SAFETY REQUIREMENTS (FAILSAFE) WITH 11+PE CONNECTOR

For applications with proportional control valves where certain safety regulations are applicable, a safe metering spool position is needed in order to avoid potential damage. Therefore, a failsafe version is offered as an option for the multi-stage Moog Proportional Control Valves. After switching off the 24 V supply to the safety solenoid valve, this failsafe function causes a safe metering spool position, overlapped centered position or fully opened A➡T or B➡T. In order to move the spool to the safe centered position with D680 Series failsafe valves, the two control chambers of the main stage are hydraulically short circuited via a 4/2-way solenoid valve. The spring force moves the spool into the overlapped centered position.

In order to reach the fully opened position A➡T with D680 Series failsafe valves, the spring force (after the control chambers have been short circuited) pushes the spool to the end position A➡T or B➡T. With failsafe valves, it is possible to check whether the main spool is in safe position. If the main spool is within the defined safe range, the logic output signal at pin 11 is > + 8.5 V. If this signal is < + 6.5 V, then the main spool is outside the safe range. This logic signal may be delayed up to 500 ms. To reduce the failsafe switching time, it is advised to both switch off the supply of the 4/2-way valve and the enable signal at the same time.

NOTE:

According to DIN-EN 954-1, a higher safety category can be achieved if a failsafe valve is used.

ELECTRIC CHARACTERISTICS

4/2-way solenoid valve for the failsafe version. For more information on failsafe versions, see Moog Application Note AM 423 E.

Valve version	4/2-way solenoid valve
Function	electro magnetic
Nominal voltage U_N	24 V DC (min. 22.8 V DC, max. 26.4 V DC)
Nominal power I_N	1.35 A
Nominal power P_N	33 W

Connector wiring

DIN EN 175301 Part 803 with free wheel- and light diode

D683/D684 SERIES 2-STAGE PROPORTIONAL CONTROL VALVE WITH D633-7... SERIES PILOT VALVE AND 4/2-WAY SOLENOID VALVE FOR THE FAILSAFE VERSION

Hydraulic symbol:
Symbol shown with pilot pressure; electric supply on and solenoid valve magnet off.

FAILSAFE VALVE ELECTRONICS WITH SUPPLY VOLTAGE 24 VOLT AND 11+PE POLE CONNECTOR

Command signal 0 to ±10 mA floating
 Valves with current command input
 The spool stroke of the valve is proportional to $I_4 = -I_5$.
 100% valve opening P →A and B →T is achieved at $I_4 = +10$ mA.
 At 0 mA command, the spool is in centered position.
 The input pins 4 and 5 are inverting. Either pin 4 or 5 is used according to the required operating direction. The other pin is connected to signal ground at cabinet side.

Command signal 0 to ±10 V
 Valves with voltage command input
 The spool stroke of the valve is proportional to $(U_4 - U_5)$.
 100% valve opening P →A and B →T is achieved at $(U_4 - U_5) = +10$ V.
 At 0 V command, the spool is in centered position.
 The input stage is a differential amplifier. If only one command signal is available, pin 4 or 5 is connected to signal ground at cabinet side according to the required operating direction.

Actual value 4 to 20 mA
 The actual spool position value can be measured at pin 6 (see diagram on the top). This signal can be used for monitoring and fault detection purposes.
 The spool stroke range corresponds to 4 to 20 mA.
 The centered position is at 12 mA. 20 mA corresponds to 100% valve opening P →A and B →T .

Circuit diagram for measurement of actual value I_6 (position of main spool) for valves with 11 + PE pole connector (signal "M and X")

(Signal type "D" R_L integrated on electronics)

The position signal output 4 to 20 mA allows to detect a cable break when $I_6 = 0$ mA. For failure detection purposes, it is advised to connect pin 6 of the mating connector and route this signal to the control cabinet.

Note: Enable input
 With enable signal off, the main spool will move to a safe position. Spool position ± 3%.

- a) Defined centered position. (Unbiased pilot valve). Function code A¹⁾.
- b) End position (Biased pilot valve). Function code B¹⁾.

¹⁾ see type designation

GENERAL REQUIREMENTS

- Supply 24 V DC, min. 18 VDC, max. 32 VDC
 Current consumption max. 800 mA
 Additional supply 24 V DC failsafe valve and current consumption 1.35 A to pin 9 →10.
- All signal lines, also those of external transducers, shielded.
- Shielding connected radially to ⊥ (0 V), power supply side, and connected to the mating connector housing (EMV).
- EMV: Meets the requirements of EN55011:1998+A1:1999 (limit class: B) and immunity according to EN61000-6-2:1999
- Minimum cross-section of all leads ≥ 0.75 mm² (AWG 18). Consider voltage losses between cabinet and valve.
- Note: When making electric connections to the valve (shield, protective earth) appropriate measures must be taken to ensure that locally different earth potentials do not result in excessive ground currents.
 Also see Moog Technical Note TN353.

WIRING FOR VALVES WITH 11+PE POLE CONNECTOR WITH INTEGRATED SOLENOID VALVE ELECTRICAL PANEL SUPPLY
 To EN 175201 Part 804, and mating connector (type E, metal shell) with leading protective earth connection (\perp).
 Also see wiring instructions (on page 40). Logic function G and H.

SINGLE ANALOG INPUT 6+PE AND 11+PE

0 to ± 10 mA floating input signal

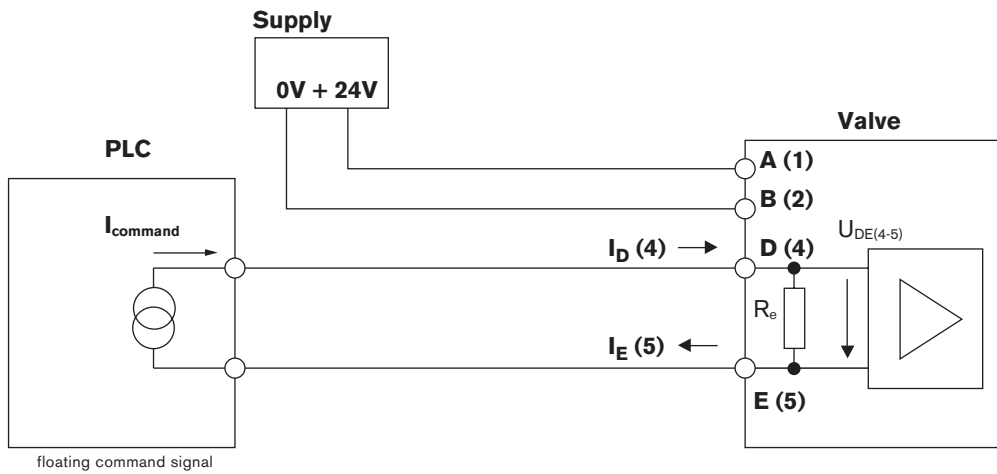

The spool stroke of the valve is proportional to $I_{D(4)} = -I_{E(5)}$.

At $I_{D(4)} = +10$ mA, command signal the valve is 100%

$P \rightarrow A$ and $B \rightarrow T$. At $I_{D(4)} = 0$ mA, the spool is in the defined centered position.

Position signal curve

0 to ± 10 V differential input signal

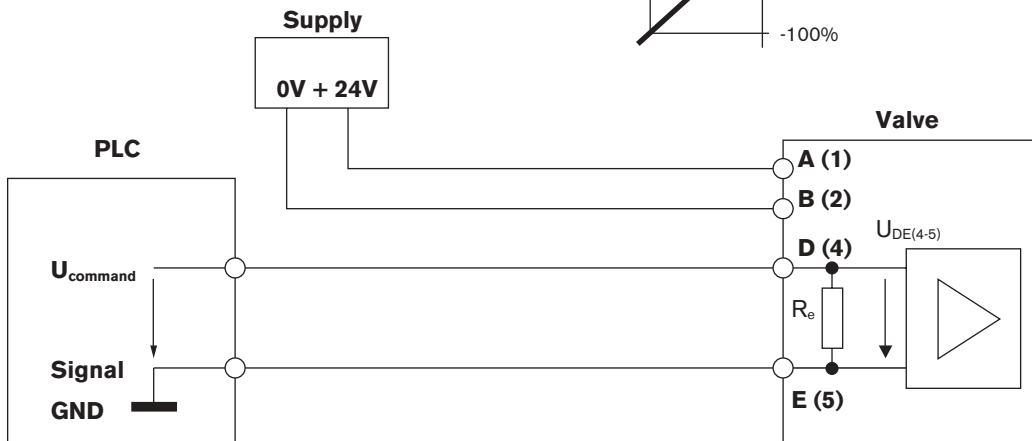

The spool stroke of the valve is proportional to $U_{D(4)}$.

$U_{D(4)} = +10$ V input moves spool 100% $P \rightarrow A$ and $B \rightarrow T$.

At nominal value $U_{D(4)} = 0$ V, spool in defined centered position.
